

## Opening/closing test stand

The test stand for testing, opening and closing of the desired component will be adapted with functionality and dimensions to the workpiece under test. The tests carried out allow sensory determination of the wear of moving parts after a given number of cycles.

It is possible to implement a vision system for automatic monitoring of the wear of the components under test.

The device allows selection of the number of opening/closing cycles on the operator panel and their automatic counting. In addition, it allows statistical processing of the recorded data by generating charts and data reports of the tested workpieces.
