

Product storage test bench

The stand is used to test the stability of a column of products stored in a “one on top of the other” manner. Any such prototype can be customized to meet the needs of the production facility, and its functions can be expanded. The stand, equipped with a laser, allows monitoring changes/deformations in the stored equipment and its position, which protects against unwanted events. This keeps the risk of damage to a minimum, while allowing 100% utilization of resources and storage space.
